

Five features that would move the product

Ghostly247 today does the hard part well: it acts as a real person inside a real browser session, safely. What it doesn't yet do is prove it worked, sound like the person paying for it, or aim at anything better than whatever the home feed happens to serve. These five close those gaps — ranked by effect on retention and conversion, not by effort.

1 Growth scoreboard

RETENTION

- | | |
|-----------|---|
| ON X | Nothing new happens on X — Ghostly just watches. Once a session it glances at the user's profile and notes their follower count. A day or two after leaving a reply, it quietly reopens that reply to see how many likes and responses it earned. |
| THEY GET | Followers climbing (or not) since install. Which replies landed and which fell flat. What share of people followed back. Today the dashboard says "47 likes, 12 replies" — true, and silent on whether any of it worked. |
| WHY FIRST | This is the churn engine. An autopilot with no scoreboard gets cancelled, because nothing in the product answers "am I growing?" — so the cancel button answers it instead. |

2 Replies in your own voice — and approve before they post

QUALITY · TRUST

- | | |
|----------|---|
| ON X | Once, at setup, Ghostly scrolls the user's own profile and reads their last 50 posts — sentence length, lowercase habits, how they actually write. Every reply after that is written that way. And instead of posting straight off, replies wait in the extension for a tap: Approve or Skip. |
| THEY GET | Replies that stop reading like a template. Right now every user on "friendly" tone shares one voice — anyone following two Ghostly users can spot it. And for the first week they see every reply before it goes public, instead of gambling their reputation on a tool they just installed. |
| NOTE | This was built once and lost before it was committed; the approval endpoints are already live on the server, wired to nothing. Cheaper to finish than it looks. |

3 Better targeting — live search and early replies

REACH

- | | |
|----------|--|
| ON X | Two new places Ghostly works. It opens the <i>Latest</i> tab of a search — say <i>indie hackers</i> — and works down live posts on that topic. And it checks the user's target creators every few minutes, so when one posts, their reply is among the first ten rather than the four hundredth. |
| THEY GET | Reach instead of luck. The home feed shows whoever X decides to show; search shows the topic they actually care about. An early reply under a large account is seen by that account's whole audience — the real growth mechanic on X, and one Ghostly can't do today. |
| BONUS | Fixes keyword matching, which currently fires "ai" on <i>said</i> and <i>chair</i> . Fewer replies that make no sense. |

4 Never silently break

RELIABILITY

ON X	Invisible to the user. X changes its layout every few weeks; when it does, Ghostly's buttons stop working — it opens a tab, scrolls, and does nothing. Today that stays broken for days until a Chrome Web Store review clears, and we only hear about it from support email.
THEY GET	A fix that reaches them in minutes instead of days, and a team that spots the break the moment it starts rather than a week in.
WHY IT COUNTS	Nobody asks for this — and <i>"it just stopped working"</i> is the most common complaint about tools in this category. It's what stops a week of paid-for silence.

5 Real posting, not just replying

UPSELL

ON X	Schedule at an actual time — Tuesday 9am, not just "Tuesday." Post threads, not only single tweets. And keep a running queue that drafts new posts in the user's own voice, from their topics and from their past posts that performed.
THEY GET	A profile worth landing on. Ghostly's replies send people there — if it's empty, they leave. This closes the loop: the traffic <i>and</i> a reason to stay.
BUSINESS	The natural Pro upsell, and the feature that makes Ghostly a daily-open habit instead of a background service people forget they're paying for.

Suggested order

2 → 1 → 5, with 4 running alongside.

Each one makes the next cheaper: the voice profile from #2 drafts both replies and scheduled posts, and the performance data from #1 tells the content queue in #5 what to write more of. #4 isn't a feature — it's insurance, and it should ship whenever there's a spare day.

Three smaller things worth fixing on the way

- **Active hours don't work.** The setting exists in the UI and is never read — the engine will happily run at 4am. Small fix, real safety issue.
- **The free tier is 50 actions a month** — roughly one session. That's a teaser, not a trial; most people hit the wall before they've seen the product work.
- **There are no automated tests.** For software whose failure mode is posting the wrong thing publicly under a customer's name, the quota maths and the reply pipeline deserve a few.

Pick two if it has to be two: #1, because we currently give users no proof the product works, and #2, because *"it sounds like a bot"* is why people uninstall tools in this category.
